ESSENTIAL MATHEMATICS

## SUBJECT: MEASUREMENT

## ASSESSMENT TYPE: 1: SKILLS \& APPLICATIONS

DESCRIPTION: In this assignment you will apply various measuring skills to a range of different contextualized applications.

This assignment has FOUR tasks:

- Task 1: LINEAR MEASUREMENT
- Task 2: MEASURING CUBOIDS
- Task 3: MEASURING SPHERES, CONES AND CYLINDERS
- Task 4: MEASURING ENERGY

As you work through the tasks in this assignment, you need to record all of your working to provide clear evidence of the steps you have taken to arrive at a solution.

## ASSESSMENT

 CRITERIA:Application of mathematical skills and techniques to find solutions to practical problems in context

CT3 Gathering, representation and interpretation of data

CT4 Use of electronic technology to find solutions to problems

RC3 Use of mathematical notation, representations and terminology

## LINEAR MEASUREMENT

## Task. For two selected logos, use appropriate measuring equipment to measure and record as many linear measurements as you can using appropriate units of measurement

- Measure all straight lines
- Find the radius of all curved lines
- Measure lengths and widths of key shapes
- Measure any relevant negative spaces

## Here is an example:

Insert an example from the internet.
Available options include:

- 1971 'Shell' logo by Raymond Loewy
- 1977 ‘Apple’ logo by Rob Janoff

## Provide students with copies of a range of corporate logos to select <br> from. For example:

- 'NITV' logo,
- 'Facebook' logo
- 'Twitter’ logo
... or similar.

## Extension task:

Use the measurements you have obtained to recreate one of these logos in Adobe Illustrator or similar

## OMEASURING CUBOIDS

## Task. For shapes a, d and e:

- Estimate the total surface area of the shape in $\mathrm{cm}^{2}$
- Calculate the surface area of the front surface in $\mathrm{cm}^{2}$
- Calculate the total surface area of the shape in $\mathrm{cm}^{2}$
- Calculate the volume of each cubiod in $\mathrm{cm}^{3}$
- Using the formula 1 inch $m 2.5 \mathrm{~cm}$, calculate the volume of each cuboid in inches ${ }^{3}$ Show all of your working

## For shapes $\mathbf{b}, \mathbf{c}$ and f :

- Estimate the volume of each cuboid in ml
- Calculate the surface area of the front surface in $\mathrm{cm}^{2}$
- Calculate the total surface area of the shape in $\mathrm{cm}^{2}$
- Calculate the volume of each cubiod in $\mathrm{cm}^{3}$
- Calculate the capacity of each cuboid in ml - ( 1000 cubic $\mathrm{cm}=1000 \mathrm{ml}$ (1 litre))

Begin by estimating the thickness of the packaging material and deducting this from your measurements

## Show all of your working

## OMEASURING SPHERES, CONES \& CYLINDERS

## Task. For shapes a, c and d:

- Calculate the surface area of one circular face of each cylinder
- Calculate the volume of each cylinder in $\mathrm{cm}^{3}$
- Calculate the capacity of each cylinder in $\mathrm{ml}-(1000$ cubic $\mathrm{cm}=1000 \mathrm{ml}$ (1 litre))

Begin by estimating the thickness of the vessel walls and deducting this from your measurements Show all of your working

## For shapes $b, f$ and $h$ :

- Calculate the surface area of each circular face of each truncated cone
- Calculate the volume of each truncated cone in $\mathrm{cm}^{3}$
- Calculate the capacity of each truncated cone in $\mathrm{ml}-(1000$ cubic $\mathrm{cm}=1000 \mathrm{ml}$ (1 litre) $)$

Begin by estimating the thickness of the vessel walls and deducting this from your measurements
Show all of your working

## For shape g:

- Calculate the surface area of the sphere
- Calculate the volume of the sphere in $\mathrm{cm}^{3}$
- Calculate the capacity of the sphere in ml - ( 1000 cubic $\mathrm{cm}=1000 \mathrm{ml}$ ( 1 litre))

Begin by estimating the thickness of the vessel walls and deducting this from your measurements Show all of your working

## For shape e:

- Calculate the surface area of the eliptoid
- Calculate the volume of the eliptoid in $\mathrm{cm}^{3}$
- Calculate the capacity of the eliptoid in $\mathrm{ml}-(1000$ cubic $\mathrm{cm}=1000 \mathrm{ml}$ (1 litre))

Begin by estimating the thickness of the vessel walls and deducting this from your measurements Show all of your working

## O MEASURING ENERGY

## Tasks.

1. Select $\mathbf{6}$ to $\mathbf{1 0}$ plug-in household electrical appliances that are used in your home.

- Use the website www.energyrating.gov.au or the general internet to determine the amount of electical energy, in kilowatts ( kW ) each appliance typically uses
- Estimate the average number of hours your household uses each appliance for each week
- Calculate the number of kilowatt hours used per week for your selected electrical appliances using the following formula for conversion between power and energy:
i. $\quad$ energy $=$ power $(\mathrm{kW}) *$ time
ii. or, kilowatt hour $(\mathrm{kWh})=$ power $(\mathrm{kW}) *$ hour $(\mathrm{h})$
iii. or (because there are 1000 watts in a kilowatt $\mathrm{kwh}=(\mathrm{W} * \mathrm{~h}) / 1000$
(because you are calculating the number of kWh per week, hours (h) will be the number of hours per week that you use each appliance)
- Organise the data you have gathered into a table in Excel and create a bar graph to compare the energy consumption of each appliance
- Record some conclusions about the energy consumption of the appliances you have compared (most power hungry, most economical etc)

2. Select the electical appliance from task $\mathbf{1}$ that is the least energy efficient

- Work through the same steps you went through in Task 1 (including creating a bar graph in Excel) to compare a selection of 4 to 6 comparable variations of the same appliance (fridges, for example) from a range of different brands to find the most energy efficient option
- Based on a cost of 40 cents per kWh , measure and compare the cost of running each appliance in your house for a year
- Determine how much money your household could save per year using the most energy efficient appliance compared with the least energy efficient appliance
- Find the cost of the most energy efficient appliance and determine how long it would take for you to make back the money you might spend switching from the least energy efficient appliance to the most energy efficient appliance

## HACK 1.

Beverage company 'Hoopla' want you to create packaging designs for a new range of 'energy' drinks and iced coffees. Hoopla don't want their product marketed as being unhealthy high sugar, high caffene products. Rather, they want to market their products as high energy hits, with 'double the energy' of competitors products. To achieve this, they want their cans to be design hacks of battery packaging designs.

- Their 250 ml energy drink cans need to be scaled to the proportions of ' $A$ ' batteries
- Their $\mathbf{5 0 0} \mathbf{m l}$ iced coffee drink cans need to be scaled to the proportions of ' $\mathbf{C}$ ' batteries
- Determine an appropriate unit of measurement and create an accurate, to scale' diagram of an 'AA' and ' $C$ ' battery, including circle radius and circumference measurements
- For one can size, record measurements for typography and other design elements for a selected battery design
- For both can sizes, determine the volume of a drink can if it was the same size as each battery
- Calculate the scale factor needed to achieve the correct proportions to create an:
i. 'A' battery proportion 250 ml can
ii. 'C' battery proportion 500 ml can
- Accurately measure to create a 'to scale' shape net for each can size
- For one can size, create a desigh hack energy drink package design, replicating the scaling and look of the styling and typography elements from a selected battery design

## HACK 2.

Hoopla need to put a positive spin on some negative nutritional information.To achieve this, they want you to create a design hack of the Australain Energy Rating Label, with the star rating showing the percentage of daily energy consumption per serve.

- Research to determine appropriate daily energy consumption for a person of a selected age
- Research to determine the amount of kilojoules needed to be double that of a standard energy drink or iced coffee
- Calculate the percentage of daily energy intake from consumption of a can of Hoopla energy drink or iced coffee
- Calculate how to represent this information in degrees on a $180^{\circ}$ degree semicircle
- Create your design hack energy star label and incorporate it into your can design
